Objective and ambition

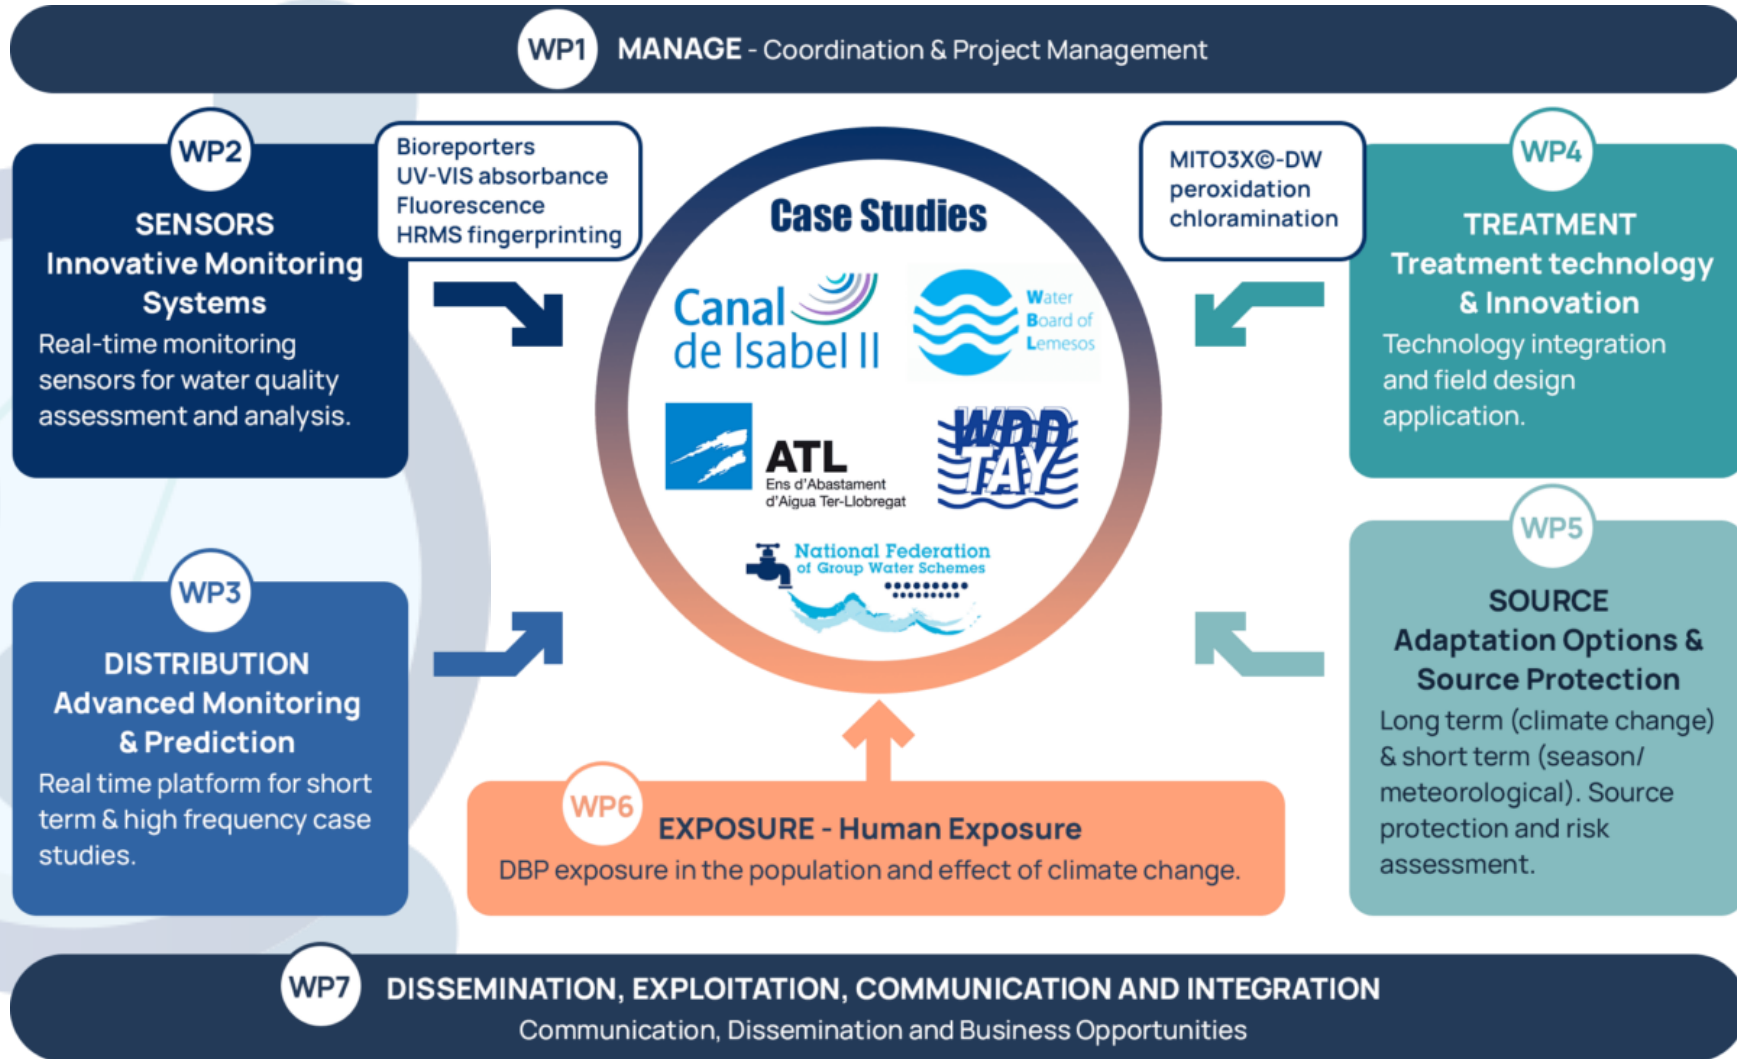

intoDBP will develop, test, scale-up, validate and benchmark innovative tools and strategies **to protect catchments and minimize human exposure to DBPs** under current and future climates, without compromising disinfection efficacy, and which could be applied at the global scale.

- Key innovations:**
- On-line fluorescence sensors
 - On-line bioreporters
 - Disinfection and precursor removal technology
 - Algorithms for DBP formation in DWTPs and networks
 - Network models to optimize sensor deployment
 - Models to forecast source water quality changes
 - Human exposure models

Adapted from (Evlampidou, 2020)

❑ CS1-LIMASSOL (CYPRUS)

high variability of source water and quality and high formation of THMs.

❑ CS2- BARCELONA (SPAIN)

high THMs formation potential in distributed water and changing conditions in the source reservoirs. High concentration of bromide in drinking water sources.

❑ CS3- MADRID (SPAIN)

possible formation of N-DBPs (e.g., NDMA) from generation of chloramines

❑ CS4- Co. MAYO (IRELAND)

high formation of THMs from peatland dominated catchments. EU infringement for unsafe drinking water.

A large, light blue magnifying glass illustration is centered on the left side of the slide. Inside the lens, there is a composite image: a white cloud with blue rain falling over a green landscape with a blue river. To the right of the river is a blue bar chart with four bars of increasing height, and a green arrow pointing upwards and to the right, symbolizing growth or forecasting.

1. Climate and source forecasting workflow

A forecasting workflow has been built to link climate, hydrology and source water quality, helping anticipate precursor loads and support prevention-oriented source protection

<https://doi.org/10.5194/egusphere-2025-4049>

A risk assessment methodology for climate-driven source-water DOM risks and mitigation across European sites

DBP Risk Assessment Framework

- An index-based methodology will assess how climate and land-use change affect DOM-related risks in source waters.
- It combines climate, land-use and water-quality projections to estimate future DBP formation risks.
- It can support monitoring priorities, investigations and source protection within adaptive management strategies.

2. Integrated monitoring toolbox for DBP assessment

A source-to-tap monitoring toolbox is now in place, combining sampling methods, DBPFP algorithms, fluorescence screening, HRMS fingerprinting and bioassay components

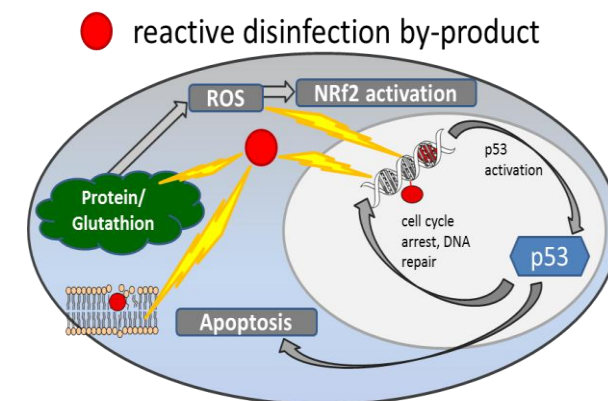

Development of in-vitro bioassays for off-line in-vitro toxicity measurements

Results of Single chemicals:

- Half of the chemicals activated ARE at concentrations below IC10 (cytotoxicity)
- All chemicals were cytotoxic in at least one assay
- No chemical was active in ER α Micronucleus assay
- aCYP induced genotoxic effects for two chemicals
- aCYP led to overall increased cytotoxicity

Oxidative stress is the dominant and most sensitive biological response to DBPs, which strongly supports using AREc32 in intoDBP.

[17/10m]

3. Optical sensing tools for real-time DBP risk tracking

Optical tools now allow real-time assessment of DBP precursor dynamics, with UV-VIS and fluorescence methods already developed and tested in case-study conditions

Development of a fluorescence-based tool and adaptation for real-time measurement

<p>Task 2.2</p>	<p>Development of a fluorescence-based tool and adaptation for real-time measurement [Lead: UNICT] [M1-M18]</p>
 <p>Degree of achievement</p>	<ul style="list-style-type: none"> • UNICT developed a fluorescence-based tool for real-time DBP measurement, using selected excitation/emission pairs. • Two prototype sensors were created, interfacing with Programmable Logic Controller (PLCs) via analogue and digital outputs. • Sensors were calibrated and validated with strong correlations to laboratory data (R^2 values of 0.94 for I3 and 0.98 for I5). • The tool effectively predicted DBP concentrations, detailed in Deliverable D2.3, submitted to the EU Funding & Tenders Portal.

Figure 2. Left: Picture of the PT. Right: probe of the customized fluorescence tool

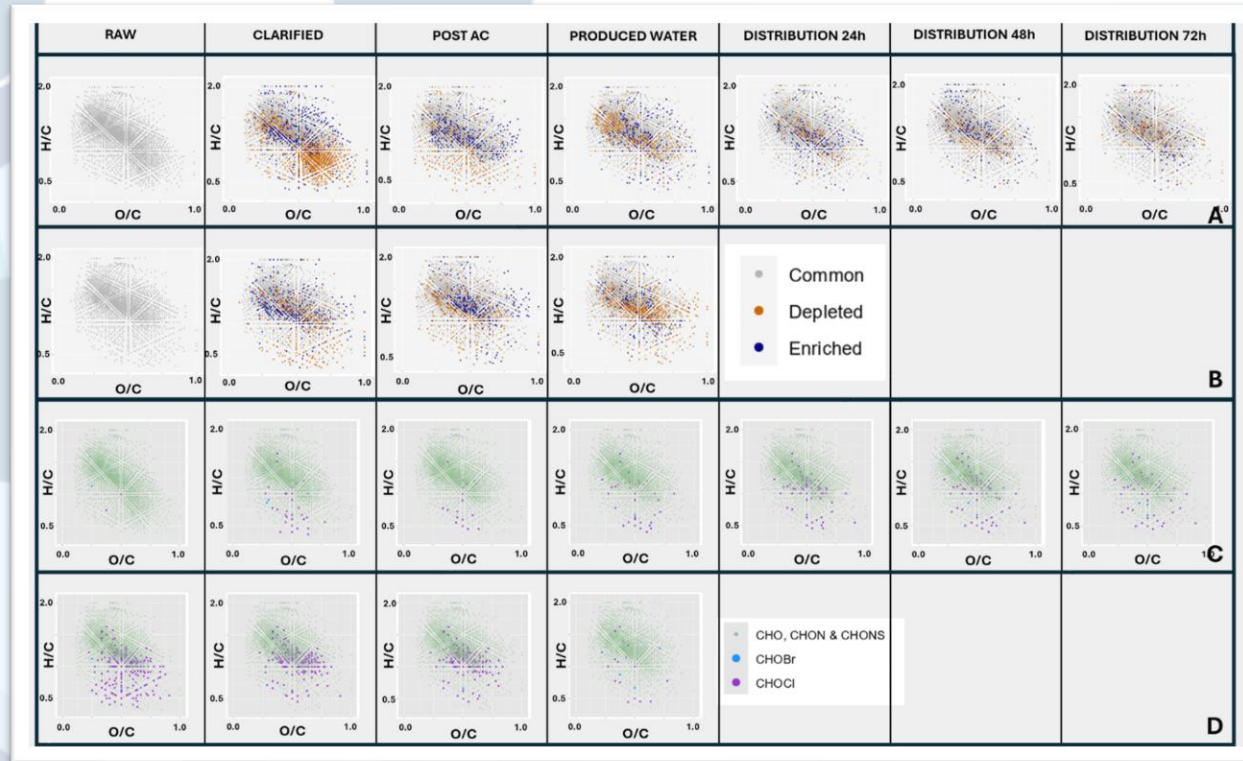

Figure 3. Detail of an online connection of the fluorescence probe

Comparison of UV and fluorescence signals to HRMS fingerprinting

- ✓ Selective DOM removal
- ✓ Formation of new features
- ✓ Differences between real samples and FP samples

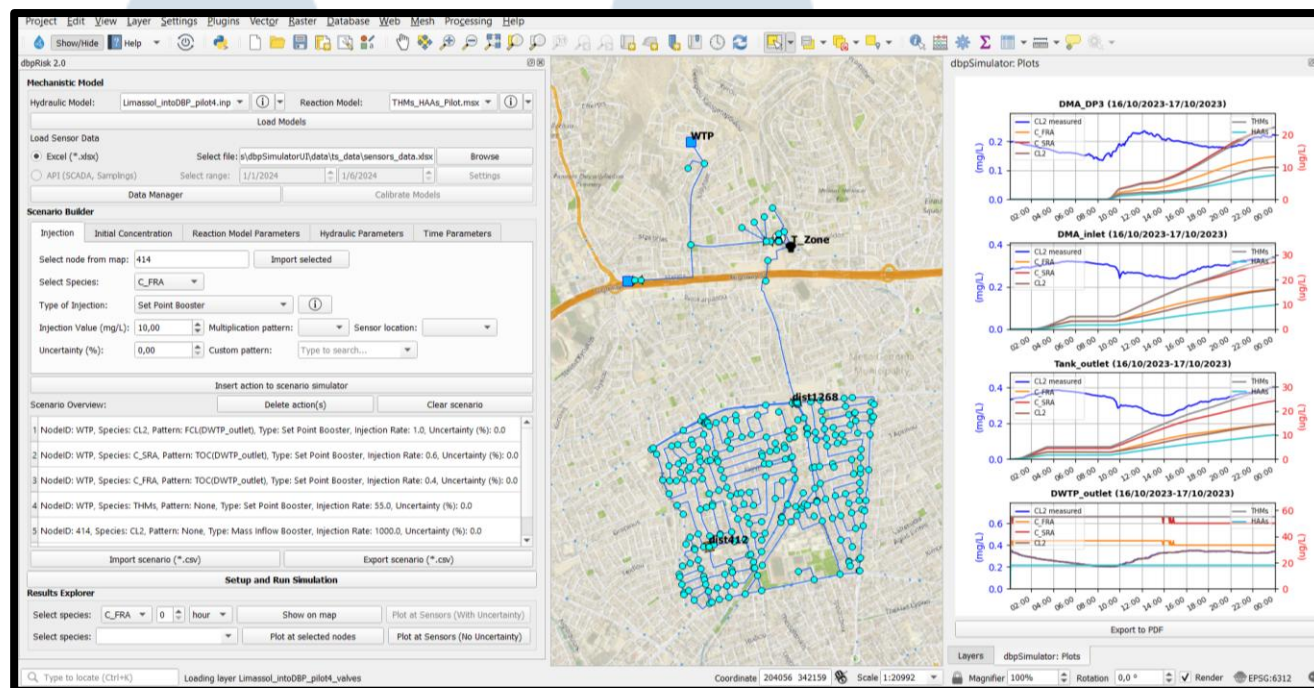

Figure 1. Mean relative changes in the molecular features detected across all samplings along the DWTP (A) and FP samples (B), highlighting depletion and enrichment trends based on features showing at least a tenfold change in abundance compared to the previous treatment stage (A and B). Van Krevelen diagrams showing the distribution of molecular features at each DWTP (C) and FP (D) sampling points, distinguishing halogenated from non-halogenated compounds.

4. Digital platform for DBP prediction in water networks

The project delivered a digital DBP prediction platform (dbpRisk 2.0) that combines hydraulic modelling, water-quality data and scenario analysis for network decision support

dbpRisk 2.0: Software tool for simulating DBP formation in WDN

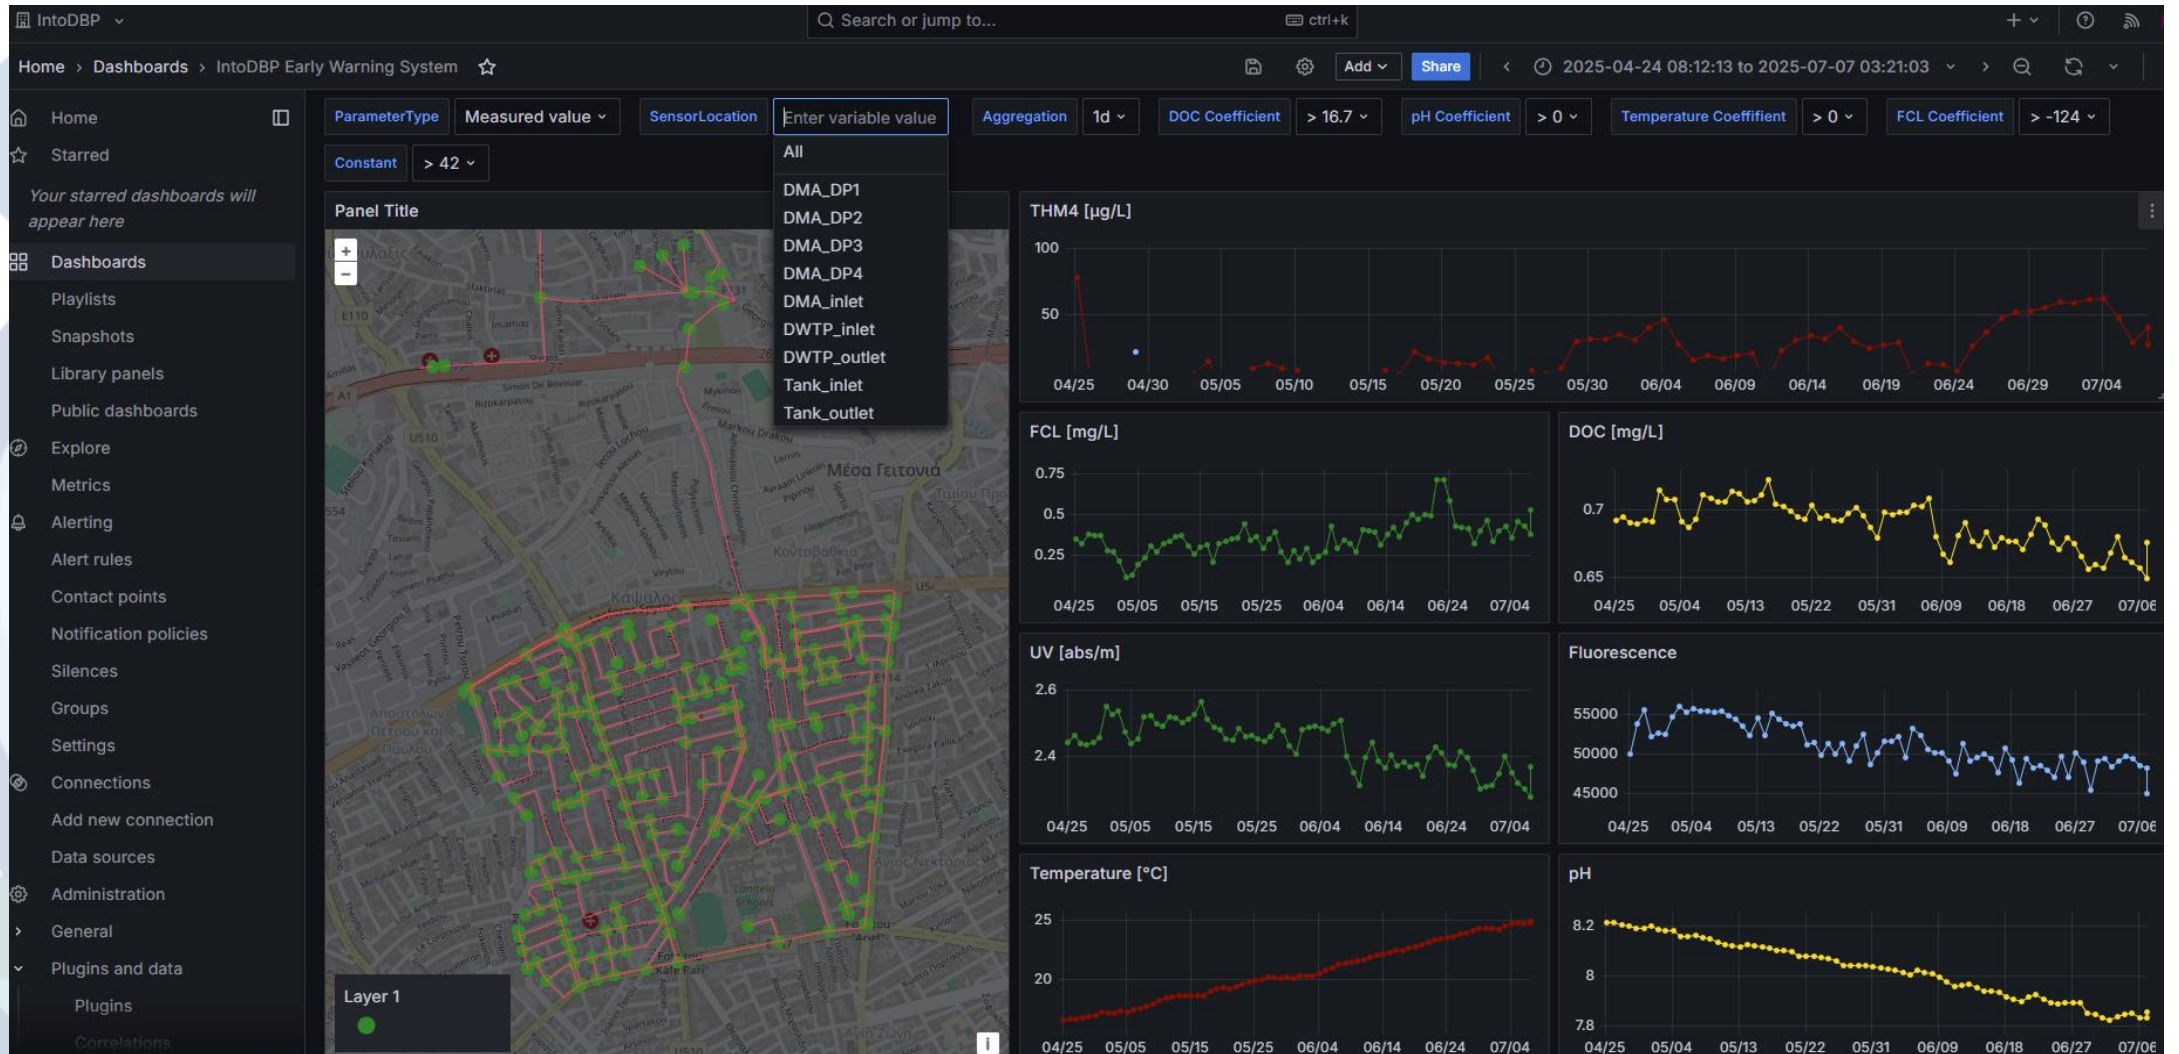

<https://plugins.qgis.org/plugins/dbpRisk2/>

dbpRisk 2.0
 Plugin ID: 3909
 This plugin created for the IntoDBP project.

[About](#) [Details](#) [Versions](#) [Stats](#)

dbpRisk 2.0 is a QGIS plugin designed to simulate and assess the formation of disinfection by-products (DBPs) in drinking water distribution networks. It performs simulation experiments using EPANET-MSX files to model chemical reactions under various conditions and uncertainties. The plugin enables users to evaluate how different parameters influence DBP formation, offering insight into water quality dynamics. By integrating these simulations into the QGIS environment, dbpRisk 2.0 allows for spatially-informed risk analysis, helping decision-makers and researchers visualize, predict, and manage DBP-related risks more effectively.

5. MITO3X pilots advancing treatment validation

The MITO3X drinking water pilots have moved into implementation and early validation, with first evidence of improved DBP control under monochloramine and pre-oxidation/AOP conditions

**Construction and operation of two MITO3X[®] with integrated sensors at the CSs
(left Madrid, Spain and Limassol, Cyprus pilot plant)**

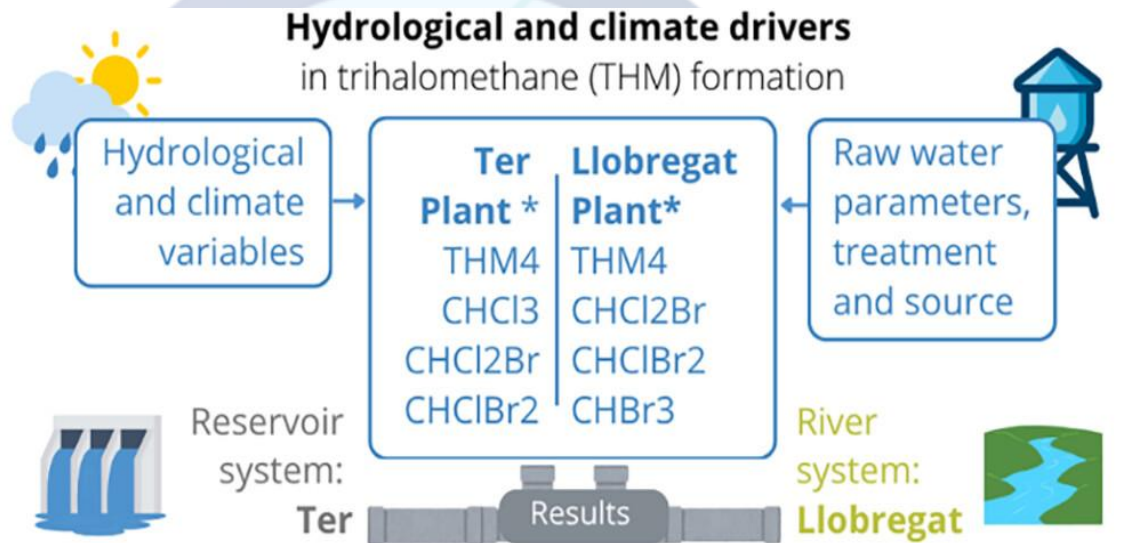

A stylized illustration within a light blue circular frame. On the left is a simple grey human figure. In the center is a grey water tap with a single blue drop falling from it. On the right is a white document with a green checkmark at the top, several horizontal lines representing text, and a yellow folded corner at the bottom right.

6. Exposure and policy outputs informing recommendations

The project has already generated strong exposure and policy evidence, including population surveys, behaviour analysis and policy briefs to support decision-making

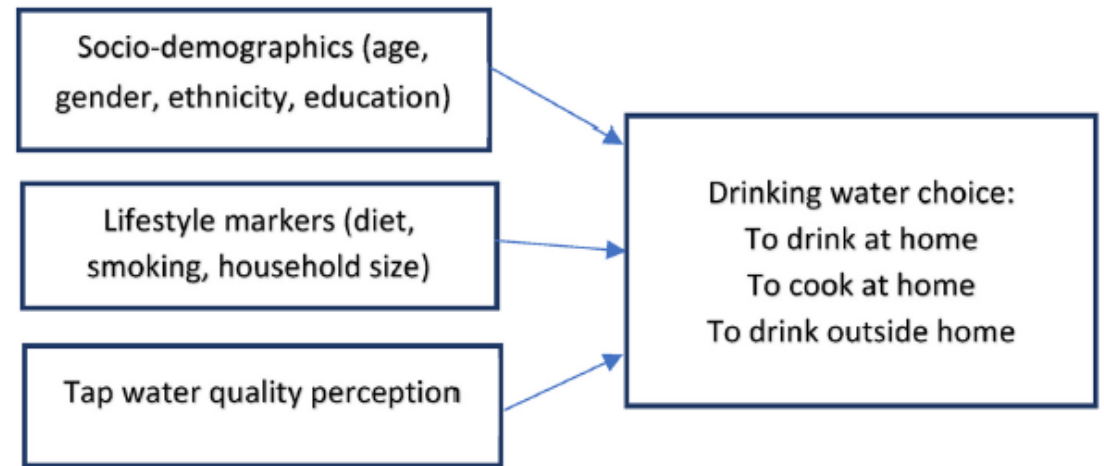

Impact of Climate and Hydrological Variability on Drinking Water Production and Trihalomethane Levels: A Case Study in Barcelona, Spain (2010–2024)

*THM4 = total trihalomethanes, CHCl3= chloroform, CHCl2Br= bromodichloromethane, CHClBr2= dibromochloromethane, CHBr3= bromoform
